                                                                                                                                                                                                                                                                                       362
                                                                                                                                                                                                                                                                                                                            302 CCACGGTGGTCACGGGCAATTGCGGCATCAGCCTGGCGCCGCTGGCGCCAACGCCAACCCGC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to the cloning and sequencing of the cluster encoding a modular type I polyketide synthase (PKS) enzyme involved in the biosynthesis of the macrolide antibiotic nystatin. The nystatin PKS is useful as antifungal antibiotics. The present sequence is a Streptomyces noursel nysl DNA of nystatin PKS gene c.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            422
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to the cloning and sequencing of the gene cluster encoding a modular type I polyketide synthase (PKS) enzyme involved in the biosynthesis of the macrolide antibiotic nystatin. The nystatin PKS is useful as antifungal antibiotics. The present sequence is a Streptomyces noursei nystatin PKS gene cluster DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 125401 BP; 15664 A; 49692 C; 42871 G; 17174 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                                                               AAQ73500 shows the Pseudorables virus (PRV) large latency transcript (LLT). The basic sequence is derived from PRV strain Infh and PRV strain Ka. The LLT overlaps and is transcribed in the opposite orientation with respect to the EPO (early polypeptide 0) and the immediately early gene (IE180). EPO is nonessential for replicatio, LTT is the only gene expressed during PRV latency, and the IE180 gene is absolutely necessary for PRV replication. However there are 2 copies of IE180 in the genome. It is expected that PRV lacking one of the IE180 copies is viable. Deletions in the non-overlapping regions of these 3 genes will generate single deletion routants, while deletions in overlapping regions will generate double deletion
                                                   5484
                                                                                                                                                                5604
                                                                                                                                                                                                                                                                                             mutants. The invention is concerned with the construction of attenuated viruses which have a reduced ability to reactivate from latency. This can be achieved by functionally disabling the expression of the EPO gene, or by disrupting the synthesis of the LLT, or both (See also AAQ73501 and AAR60620-24)

                                                                                            CC The specification describes antisense oligonucleotides (AAX52869-X55271) CC directed against at least 2 mRNAs selected from target genes, coding and CC initiation codons, genomic flanking regions, intron-exon borders, the CC s'-end, the 3'-end and the juxta-section between coding and non-coding CC or more diseases, conditions or mixtures. The antisense oligonucleotides conditions or mixtures. The antisense oligonucleotides (specifically AAX55272-74. These multiple target CC antisense treatment of diseases and conditions. Typical diseases and CC disjonucleotides (specifically AAX55280-271) can be used for the CC conditions are those associated with impaired respiration and conditions are those associated with impaired respiration and CC inflammation, including lung diseases, pulmonary vasoconstriction, cc respiration, respiratory diseases, pulmonary vasoconstriction, cc pulmonary hypertension, pulmonary vasoconstriction, emphysema, chronic constructive pulmonary disease (COPD), and cancers such as leukemias, carcinomas, carcinomas e.g. colon cancer, breast cancer, lung cancer, cc hepatic metastases, as well as all types of cancers, melanoma, carcinoma, kidney cancer, melanoma, cc or have metastasized to the luncs. Including breast and progratate cancer.

The nystatin PRS is useful as antifungal antibiotics. The present sequence is a Streptomyces noursel nys2 DNA of nystatin PRS gene cluster.

D for

밁 Š 맑 Š 밁 Ş 몂 Ş 밁 S 밁 Š 20 밁 밁 Š 맑 맑 Ş Š CC modifies the biological molecule. The method comprises contacting the CC biological molecule with at least two different polypeptides encoded by CC ramoplanin ORFS 1-31. The polypeptides are useful for directing the CC biosynthesis of the antibiotic ramoplanin in microorganisms. An isolated CC gene cluster comprising the ORFS is useful as substrate for CC encoding nucleic acid sequence is useful as substrate for CC encoding nucleic acid sequence is useful for generating derivatives of CC ramoplanin, for improving production or for producing variants of other CC antibiotics of the peptide class. The isolated polypeptides are useful CC in conjunction with other peptide synthesis and allowing the CC incorporation of Thr into a peptide antibiotic precursor, for modifying the CC incorporation of Thr into a peptide antibiotic precursor, for enhancing the CC incorporation of Thr into a peptide antibiotic, for enhancing secretion of CC peptide antibiotic structure, for production of an hydroxyphenylglycine CC encodining peptide antibiotic, for enhancing useretion of CC production of its variants and derivatives, for enhancing production of CC ramoplanin products or its variants or derivatives, to chlorinate HPG of CC peptide antibiotic precursor, and for designing specific nucleotide probes and primers for identifying and isolating putative lipdepsipeptide CC producing microorganisms. This polynucleotide sequence represents the CC ability genomic DNA of a ramoplanin producing Actinoplanes sp: microorganism of the invention. biomedical applications, to engineer pHA monomer synthases or to prepare biologically active agents, such as chemotherapeutics, immunosuppressants, agents to treat asthma, chronic obstructive pulmonary cholesterol-lowering agents or macrolide-based antibiotics which are active against a variety of organisms, e.g., bacteria, including multi-drug resistant pneumococci and other respiratory pathogens, as well as viral parasitic pathogens, or as crop protection agents (e.g., bacteria, including as viral parasitic pathogens, or as crop protection agents (e.g., sequences AZ87286-287294 represent desosamine biosynthetic renes from Streptomycas varances.
       Sequence 1248 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                     production of biologically active macrolides. The macrolide biosynthetic proteins are useful for synthesis of methymycin, pikromycin, neomethymycin and narbomycin. The alternative termination of polyketide synthesis may be useful to prepare novel antibiotics and polyhydroxyalkanoate (PHA) monomers. The compounds produced by the recombinant host cells are useful as biopolymers, e.g., in packaging or recombinant host cells are useful as biopolymers, e.g., in packaging or recombinant host cells are useful as biopolymers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             pikromycin, neomethymycin, narbomycin or a combination of these compounds. Recombinant or augmented cells comprising the desosamine and/or macrolide biosynthetic gene clusters are useful for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      comprising a desosamine biosynthetic gene cluster, a fragment or its biologically active variant, where the nucleic acid sequence is not derived from the eryC gene cluster of Saccharopolyspora erythraea or Streptomyces antibioticus. The invention also relates to a macrolide biosynthetic gene cluster, or fragments thereof. The macrolide biosynthetic gene cluster encodes proteins which synthesise methymycinity macrolide and the synthesise methymycinity macrolide.
                                                                         . 81777±181-477189
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated and purified nucleic acid segment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Desosamine and macrolide synthesis of methymycin a

The invention also relates to a modified recombinant patterial host cell (mrbic) in which the expression and activity of nucleic acids encoding sugar biosynthetic enzymes has been altered. The mrbics may be cultured to produce the modified sugar products, e.g. a macrolide, anthracycline, ansurgyline, avermectin, milbemycin, tetracycline, polyene, polyether, ansamycin or isochromanequinone. The present sequence is Streptomyces venezuelae sugar (desosamine) biosynthetic gene cluster Desi (4-dehydrase) gene.

CC The invention relates to an isolated and purified nucleic acid segment CC comprising a desosamine biosynthetic gene cluster, a fragment or its delived from the eryC gene cluster of Saccharopolyspora erythreae or CC delived from the eryC gene cluster of Saccharopolyspora erythreae or CC biosynthetic gene cluster cancides proteins which synthesise methymycin, neomethymycin, narbomycin or a combination of these CC pikromycin, neomethymycin, narbomycin or a combination of these CC compounds. Recombinant or augmented cells comprising the desosamine CC and/or macrolide biosynthetic gene clusters are useful for the production are useful for synthesis of methymycin, pikromycin, neomethymycin and cC are useful for synthesis of methymycin, pikromycin, neomethymycin and CC arbonycin. The alternative termination of polyketide synthesis may be compounded. The compounds produced by the recombinant host cells are useful to prepare novel antibiotics and polyhydroxyalkanoate (PHA) CC monomers. The compounds produced by the recombinant host cells are useful constructive pulmonary disease as well as other diseases involving cc antibiotics which are active against a variety of organisms, e.g., cc antibiotics which are active against a variety of organisms, e.g., cc antibiotics which are active against a variety of organisms, e.g., cc bacteria, including multi-drug resistant pneumococci and other
  Sequence 12441 BP; 1704 A; 4294 C; 4686 G;
                                                             bacteria, including multi-drug resistant pneumococci and other respiratory pathogens, as well as viral parasitic pathogens, or as crop protection agents (e.g., fungicides or insecticides) via expression of polyketides in plants. The present sequence represents the desosamine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Desosamine and macrolide biosynthetic synthesis of methymycin and pikromycin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sherman DH,

The invention relates to an isolated and purified nucleic acid segment comprising a desosamine biosynthetic gene cluster, a fragment or its biologically active variant, where the nucleic acid sequence is not carly defrom the eryC gene cluster of Saccharopolyspora erythraea or compounds antibioticus. The invention also relates to a macrolide biosynthetic gene cluster concodes proteins which synthesise methymycin, compounds. Recombinant or augmented cells comprising the desosamine compounds. Recombinant or augmented cells comprising the desosamine compounds. Recombinant or augmented cells comprising the desosamine compounds. Recombinant or augmented cells comprising the desosamine compounds. Recombinant or augmented cells comprising the desosamine compounds. Recombinant or augmented cells comprising the desosamine compounds. Recombinant or augmented cells comprising the desosamine compounds. Recombinant or augmented cells comprising the desosamine compounds protection of polyketide synthesis may be compounded to the alternative termination of polyketide synthesis may be cuseful to prepare novel antiblotics and polyhydroxyalkanoate (PHA) componers. The compounds produced by the recombinant host cells are useful compounder synthases or to prepare biologically active agents, such as chemotheramentics. Immunosuporeasants, agents to treat asthma.
respiratory inflammation, cholesterol-lowering agents or macrolide-based antibiotics which are active against a variety of organisms, e.g., bacteria, including multi-thrus accidents.
                                                                    such as chemotherapeutics, immunosuppressants, agents to treat asthma, chronic obstructive pulmonary disease as well as other diseases involved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; Figure 32; 438pp;

                                                                                Score

    No. 1s the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.
